

# The `mhsetup` package\*

Morten Høgholm (maintained by Lars Madsen)

2017/03/31

## Abstract

The `mhsetup` package provides tools for a L<sup>A</sup>T<sub>E</sub>X programming environment similar to the one described in `expl3` on CTAN although not as extensive. It is a required part of both the `mathtools` and `empheq` packages.

The description below was made before the extensive changes made to the `expl3` code available from the L<sup>A</sup>T<sub>E</sub>X Project website.

## 1 The new internal syntax

`\MHInternalSyntaxOn`  
`\MHInternalSyntaxOff`

The L<sup>A</sup>T<sub>E</sub>X3 package `l3csetup` defines the command `\InternalSyntaxOn` which makes `_` and `:` letters and then automatically restores the category codes at the end of the package. This usually works fine but when you try to load `amstext` you will experience that T<sub>E</sub>X goes into an infinite loop. Packages containing code like `\@for\@tempa:=\@tempb\do{\dots}` will not work correctly either, thus we provide an alternative version here with the pair of commands `\MHInternalSyntaxOn` and `\MHInternalSyntaxOff`. They are to be used only as a pair, because `\MHInternalSyntaxOn` defines `\MHInternalSyntaxOff` so that it restores the category codes correctly.

## 2 Handling optional arguments

The standard behavior of scanning for optional arguments in L<sup>A</sup>T<sub>E</sub>X allows any number of spaces preceding the optional argument and that is not always good in math. For that reason `amsmath` makes sure that commands like `\backslash` disallows spaces before the optional argument but at the same time it fails to provide “safe” environments. What would you expect from the following input?

```
\[
  \begin{gathered}
    [v] = 100 \\
    [t] = 200
  \end{gathered}
```

---

\*This package has version number v1.3, last revised on 2017/03/31.

\]

LATEX will see the [v] as an optional argument of `gathered` and use it. In this case the test inside `gathered` checks if it's a t or b and if it's neither it'll choose `\vcenter` internally. So you get no warning, only missing output. Another example, this time from the `empheq` package used with its `overload` option: If preceding spaces are allowed, the input

```
\begin{gathered}
    [a] = [b]
\end{gathered}
```

results in the rather strange error message

```
! Package keyval Error: a undefined.
```

`\MHPrecedingSpacesOff`  
`\MHPrecedingSpacesOn`

When using `\newcommand` etc. for defining commands and environments with optional arguments, the peek ahead is done by `\kernel@ifnextchar` (since LATEX release 2003/12/01, else `\ifnextchar`) and it is *hardwired at definition time* by `\@xargdef`. With the commands `\MHPrecedingSpacesOff` and `\MHPrecedingSpacesOn` mhsetup provides an interface to define commands and environments where the optional argument cannot have preceding spaces. You simply wrap them around the definitions:

```
\MHPrecedingSpacesOff
\newenvironment*{test}[1][default]{Start, arg: (#1)}{Ending.}
\MHPrecedingSpacesOn
\begin{test}
    [text]
\end{test}
\begin{test}[text]
\end{test}
```

Start, arg: (default) [text] Ending. Start, arg: (text) Ending.

It is of somewhat limited use in commands (control words in T<sub>E</sub>X terminology), because T<sub>E</sub>X discards the spaces. The exception is *control symbols* where T<sub>E</sub>X obeys following spaces but there are rather few of them available. All is not lost however. In the `aligned` environment from `amsmath` (shown below) a command is used as argument grabber.

```
\newenvironment{aligned}{%
    \let\@testopt\alignsafe@testopt
    \aligned@a
}{%
    \crcr\egroup
\restorecolumn@
```

```

    \egroup
}
\newcommand{\aligned@a}[1][c]{\start@aligned{#1}\m@ne}

```

By applying our trick on the grabber function, we get a space obeying version:

```

\MHPrecedingSpacesOff
\renewcommand*\aligned@a[1][c]{\start@aligned{#1}\m@ne}
\MHPrecedingSpacesOn

```

This way a nested `aligned` environment is still safe from empty first cells.

### 3 First bits of a new programming environment

```

1 <*package>
2 \ProvidesPackage{mhsetup}%
3 [2017/03/31 v1.3 programming setup (MH)]

```

#### 3.1 The new internal syntax

```

\MHInternalSyntaxOn Almost copy of \InternalSyntaxOn.
\MHInternalSyntaxOff
4 \def\MHInternalSyntaxOn{
5   \edef\MHInternalSyntaxOff{%
6     \catcode`\noexpand\~=\\the\catcode`\~\relax
7     \catcode`\noexpand\_=\\the\catcode`\_\relax
8     \catcode`\noexpand\^=I=\\the\catcode`\^=I\relax
9     \catcode`\noexpand\@=\\the\catcode`\@\relax
10    \catcode`\noexpand\:=\\the\catcode`\:\relax
11    \catcode`\noexpand\_=_\\the\catcode`\_\relax
12    \endlinechar=\\the\endlinechar\relax
13  }%
14  \catcode`\~=10\relax
15  \catcode`\_=9\relax
16  \catcode`\^=I=9\relax
17  \makeatletter
18  \catcode`\_=11\relax
19  \catcode`\:=11\relax
20  \endlinechar=' %
21  \relax
22 }
23 \MHInternalSyntaxOn
24 \AtEndOfPackage{\MHInternalSyntaxOff}

```

#### 3.2 Programming tools

The whole idea is to provide programming tools that are convenient but not yet widely available. I hope this'll be obsolete soon!

Firstly we setup a few helper functions.

```

\MH_let:NwN An alias for \let.
25 \let\MH_let:NwN \let

\MH_let:cN This one takes a \csname-\endcsname name and \lets it to a single macro. We'll
use this to setup our conditionals.
26 \def\MH_let:cN #1#2{
27   \expandafter\MH_let:NwN \csname#1\endcsname#2}

\MH_let:cc This one has takes a \csname-\endcsname name and \lets it to another
\csname-\endcsname name. To be used in constructions with weird characters
like * or alike in them and can take a \global prefix if wanted (we want that later
on).
28 \def\MH_let:cc #1#2{
29   \expandafter\MH_let:NwN\csname#1\expandafter\endcsname
30   \csname#2\endcsname}

\MH_new_boolean:n Sets up conditionals. For instance
\MH_set_boolean_F:n
\MH_set_boolean_T:n
\MH_if_boolean:nTF defines the boolean name but also the conditional \MH_if_boolean_<i>(name)>: to
be used in the ordinary
\MH_if_boolean_<i>(name)>:
  <true code>
\MH_else:
  <false code>
\MH_if:

There is also a more “LATEX-like” interface available by using the commands
\MH_if_boolean:nT{<i>(name)>}{<i>(arg)}
which will execute the argument if the current value of the boolean is ‘true’ while
\MH_if_boolean:nF{<i>(name)>}{<i>(arg)}
is the equivalent with ‘false’. Finally we have
\MH_if_boolean:nTF{<i>(name)>}{{<i>(true code)>}{<i>(false code)>}}.
```

This is the interface I have used in this package.

Initially \MH\_if\_boolean\_<i>(name)>: is ‘false’. This can be changed by saying

```
TEX: \MH_boolean_<i>(name)>_true: or
LATEX: \MH_set_boolean_T:n{<i>(name)}
```

and changed back again by

```
TEX: \MH_boolean_<i>(name)>_false: or
LATEX: \MH_set_boolean_F:n{<i>(name)}
```

And yes, we're also using alternative names for `\else` and `\fi` now. That way a simple search and replace will be all that is needed for this package to be a certified L<sup>A</sup>T<sub>E</sub>X3 package (well, maybe a little more is needed, but not much).

```

31 \def\MH_new_boolean:n #1{
32   \expandafter\@ifdefinable\csname MH_if_boolean_#1:\endcsname{
33     \namedef{MH_boolean_#1_true:}{\MH_let:cN{MH_if_boolean_#1:}\iftrue}
34     \namedef{MH_boolean_#1_false:}{\MH_let:cN{MH_if_boolean_#1:}\iffalse}
35     \nameuse{MH_boolean_#1_false:}%
36   }
37 }
38 }
39 }

40 \def\MH_set_boolean_F:n #1{ \nameuse{MH_boolean_#1_false:} }

41 \def\MH_set_boolean_T:n #1{ \nameuse{MH_boolean_#1_true:} }

42 \def\MH_if_boolean:nTF #1{
43   \nameuse{MH_if_boolean_#1:}
44   \expandafter\@firstoftwo
45   \MH_else:
46   \expandafter\@secondoftwo

58   \expandafter\@gobble
59 \MH_else:
60   \expandafter\@firstofone
61 \MH	fi:
62 }

\MH_if:w Copies of TEX primitives.

\MH_if_meaning:NN 63 \@ifundefined{MH_if:w}{\MH_let:NwN \MH_if:w =\if}{}
\MH_else: 64 \@ifundefined{MH_if_meaning:NN}{\MH_let:NwN \MH_if_meaning:NN =\ifx}{}
\MH	fi: 65 \@ifundefined{MH_else:}{\MH_let:NwN \MH_else:=\else}{}

\MH_if_num:w 66 \@ifundefined{MH_if:}{\MH_let:NwN \MH_if:=\fi}{}
\MH_if_dim:w 67 \AtBeginDocument{
\MH_if_case:w 68 \@ifundefined{MH_if_num:w}{\MH_let:NwN \MH_if_num:w =\ifnum}{}
\MH_or: 69 \@ifundefined{MH_if_dim:w}{\MH_let:NwN \MH_if_dim:w =\ifdim}{}
70 \@ifundefined{MH_if_case:w}{\MH_let:NwN \MH_if_case:w =\ifcase}{}
71 }

72 \@ifundefined{MH_or:}{\MH_let:NwN \MH_or:=\or}{}

\MH_cs_to_str:N Strip off the backslash of a macro name.

```

```

73 \def\MH_cs_to_str:N {\expandafter\gobble\string}

\MH_protected: We might as well make use of some of the extended features from  $\varepsilon$ - $\text{\TeX}$ . We use
\MH_setlength:dn \dimexpr for some simple calculations as it saves a lot of the scanning that goes on
\MH_addtolength:dn inside calc. The \protected primitive comes in handy when we want to declare
a robust command, that cannot be ‘robustified’ with \DeclareRobustCommand.
If we don’t have  $\varepsilon$ - $\text{\TeX}$  we’ll just let our private macros be aliases for the less
effective alternatives.
74 \@ifundefined{eTeXversion}
75 {
76   \MH_let:NwN \MH_protected:\relax
77   \def\MH_setlength:dn{\setlength}
