

# The `bpchem` package\*

Bjørn Pedersen

`Bjoern.Pedersen@frm2.tum.de`

2017/08/23

## 1 Introduction

This package has been written to alleviate the task of writing publications containing lots of chemistry. It provides methods for typesetting chemical names, sum formulae and isotopes. It provides the possibility to break very long names even over several lines.

This package also provides a way to automatically enumerate your chemical compounds, allowing for one-level subgrouping.

What this package does not provide: Methods to draw chemical compounds. Although there exist some packages, which were designed for this purpose (e.g. `xymtex`, `PPChTex`) they are quite limited once you get to complex organic, or metal organic compounds. I recommend using an external drawing program, possibly in conjunction with `psfrag`, in these cases.

## 2 Package options

Currently this package supports only one option:

`cbgreek`

this option causes the definitions of some macros to be changed to use the `cbgreek` fonts. As they are not available on all systems, and only in `mf` format, the default is to use the math fonts for greek symbols.

## 3 User commands in this package

### 3.1 Setting chemical sum formulae: `BPChem<chemical formula>`

`\BPChem` Within this macro you can use `\_` and `\^` for correct chemical sub- and super-scripts. Example:

---

\*This file has version number v1.1, last revised 2017/08/23.

\BPChem{C\\_2H\\_5OH} or \BPChem{SO\\_4\^{2-}}

C<sub>2</sub>H<sub>5</sub>OH or SO<sub>4</sub><sup>2-</sup>

### 3.2 Setting long chemical names: IUPAC<formula or name>

\IUPAC in addition to sub/superscripts as above, \- is a hyphen which allows further breakpoints, \| is an (invisible) Multibreakpoint.

This environment is especially useful for your long IUPAC-compound names.  
Example:

```
%\IUPAC[Tetra\|cyclo[2.2.2.1\^{1,4}]\-\un\|decane-2\|dodecyl\|5\-(hepta\|decyl\|iso\|dodecyl\|thio\|ester)}
```

Tetracyclo[2.2.2.1<sup>1,4</sup>]undecane-2-dodecyl-5-(heptadecylsodododecyl-thioester)

### 3.3 Enumerating and referencing chemical compounds: CN-label{<label>}, CNlabelnoref{<label>}, CNref{<label>}

\CNlabel CNlabel defines and use #1 (via `ref`) as label for numbering of chemical compounds. If the label has not yet been defined, it is created, otherwise it is just referenced. if you just want to define the label, use \CNlabelnoref instead.

If you want to get just the reference, use \CNref. This comes handy for figure captions or section titles, as you would get disorder in the numbering due to the moving argument otherwise.

The default style is: \textbf{\arabic{\counter}}

To change, use something like

```
\renewcommand{\theBPCno}{\textbf{\arabic{BPCno}}}
```

Example:

Alkohol \CNlabel{al} is converted to aldehyd \CNlabel{ad}. \CNref{al} can also be used otherwise, while \CNref{ad} cannot.

Alkohol **1** is converted to aldehyd **2**. **1** can also be used otherwise, while **2** cannot.

### 3.4 Using sub-labels for classes of compounds: CNlabel-sub{<label>}{<sublabel>}, CNlabelsubnoref{<label>}{<sublabel>}, CNrefsub{<label>}{<sublabel>}

\CNlabelsub These commands are the same as above, with additional sub identifier #2 added. If the primary identifier is not yet used, it will be created and can also be referenced via the normal commands.

The default style is: \textbf{\arabic{BPCno}\alph{BPCnoa}}}

To change, use something like

```
\renewcommand{\theBPCnoa}{\textbf{\arabic{BPCno}}\alpha{BPCnoa}}}
```

To demonstrate the use of sublabels, methanol \CNlabelsub{alk}{a} and ethanol \CNlabelsub{alk}{b} are both natural products. The alcohols \CNref{alk} can synthesized bio-chemically. \CNrebsub{alk}{a} is toxic, while \CNrefsub{alk}{b} is only mildly toxic.

To demonstrate the use of sublabels, methanol **3a** and ethanol **3b** are both natural products. The alcohols **3** can synthesized bio-chemically. **3a** is toxic, while **3b** is only mildly toxic.

### 3.5 Shortcuts for common idioms in chemical literature

**$^1\text{H-NMR}$ :**  $\delta$  \HNMR

**$^{13}\text{C-NMR}$ :**  $\delta$  \CNMR

*cis* \cis

*trans* \trans

$\alpha$  \balpha

$\beta$  \bbeta

$\Delta$  \bdelta

$\eta^{<\textit{nummer}>}$  \hapt{o}{<number>}

**Note:** Some of these macros are influenced by the `cbgreek` option! Use is only recommended with the `\BPChem` and `\IUPAC` commands. Some will not even work outside those commands.

## 4 Example

```
\begin{minipage}[b]{15em}
some normal text and math: $A*2=B$

Test \BPChem{ C_{2}H_{4}\^{+}}
or using math in superscript \BPChem{ C_{2}H_{4}\^{+$+$} }

\BPChem{Example\_longer subscript}\^{superscript}

Isotope: \BPChem{\_A\^{B}X\^{C}\_D}

\IUPAC{Tetra|\cyclo[2.2.2.1\^{1,4}]\-\~{}A
un|\decane-2\-\dodecyl-5-(heptadecyl|\iso|\dodecyl|\thio|\ester)}
\end{minipage}
```

and the resulting output:

```

some normal text and math: A *
2 = B, just to show it.
Test C2H4+ or using math in su-
perscript C2H4+
Examplelonger subscriptsuperscript And normal
Text again
Isotope: ABXDC
Tetracyclo[2.2.2.11,4]-undecane-2-
dodecyl-5-(heptadecylisododecyl-
thioester)

```

## 5 The code

```

<*bpchem> first comes some option setup
1 \newif\ifusecbgreek%
2 \usecbgreekfalse%
3 \DeclareOption{cbgreek}{\PackageInfo{bpchem}{cbgreek selected}\usecbgreektrue}
4 \ProcessOptions\relax

```

\textsubscript Define a textsubscript corresponting to textsuperscript. This is now also available as the package textsubscript by D.Arsenau or as part of KOMA-Script2 by M. Kohm.

```

5 \providecommand*\textsubscript[1]{%
6   \textsubscript{\selectfont#1}}
7 \def\textsubscript#1{%
8   {\m@th\ensuremath{_{{\mbox{\scriptsize\sffamily#1}}}}}}

```

a register to save the length to backspace two registers needed to get back to correct working position if one is longer than the other.

```

9 \newlength{\BPClensub}
10 \newlength{\BPClensuper}
11 \newlength{\BPCdelta}
we are in subscript and maybe the superscript was longer
12 \DeclareRobustCommand{\BPCadjustsub}{%
13   \setlength{\BPCdelta}{\BPClensuper}\addtolength{\BPCdelta}{-\BPClensub}%
14   \ifdim\BPCdelta>0pt{\kern\BPCdelta}\else\relax\fi%
15   \setlength{\BPClensub}{0pt}% reset
16   \setlength{\BPClensuper}{0pt}% reset
17 }%

```

we are in superscript and maybe the subscript was longer

```

18 \DeclareRobustCommand{\BPCadjustsuper}{%
19   \setlength{\BPCdelta}{\BPClensub}\addtolength{\BPCdelta}{-\BPClensuper}%
20   \ifdim\BPCdelta>0pt{\kern\BPCdelta}\else\relax\fi%
21   \setlength{\BPClensub}{0pt}% reset
22   \setlength{\BPClensuper}{0pt}% reset
23 }%

```

```

## Change History

v1.03	General: fixed bug in \IUPAC, \  is not getting translated to \delimiter during \write anymore . . . . .	fixed whitespace bug in \DoIUPAC . . . . .
	re-added lost email-address . . . . .	6
	added cbgreek option for using upright greek and fixed namespace, old names will still work . . . . .	6
v1.04	General: also \- was affected, fixed	6
v1.05	General: changed email . . . . .	1
v1.06	General: fixed whitespace bug in CNlabel . . . . .	7
v1.1	General: Recent L <sup>A</sup> T <sub>E</sub> X releases make \- robust as well. This results in an infinite loop. . . . .	6
	Resolved conflict with recent L <sup>A</sup> T <sub>E</sub> X releases (thanks to Ulrike Fischer and Martin Sievers) . . . . .	1
